DLP™

Additional protection for your sensitive information.

Malicious, insider attacks account for 34% of data breaches each year.¹

Are your internal security measures enough to keep your files safe from malicious employees or basic human error?

Data Loss Prevention (DLP) by NetDocuments makes it simple.

Apply policies to protect your information at the cabinet, attribute, and document levels. The DLP engine checks the policies and overrides cabinet level in favor of attribute or individual document level policies, improving the way you secure information to prevent its deliberate or accidental leakage.

Easily manage document access.

You're managing thousands to millions of documents, which means you require a simple way to restrict the actions that those authorized to access them can take. DLP by NetDocuments provides a straightforward and flexible system to enhance information protection.

Maximize information security.

Securing documents based on access rights isn't always enough. With DLP by NetDocuments, you can improve your information security by ensuring sensitive information in your NetDocuments repository is protected from misuse.

Prevent mistakes and malicious acts at their source.

DLP protects your NetDocuments files from human error and disgruntled employees alike. When in place, DLP prevents documents from being shared, emailed, edited, viewed, downloaded, and more by those who are authorized to access them.

See what modern document and email management can do for you.
